

# Manipulating Data in R

# Reshaping Data

In this module, we will show you how to:

1. Reshape data from wide (fat) to long (tall)
2. Reshape data from long (tall) to wide (fat)
3. Merge Data/Joins

# Cheatsheet

<https://raw.githubusercontent.com/rstudio/cheatsheets/main/data-transformation.pdf>

## Data transformation with dplyr : : CHEAT SHEET

dplyr functions work with pipes and expect **tidy data**. In tidy data:

Each **variable** is in its own **column**

Each **observation**, or **case**, is in its own **row**

**x %>% f(y)** becomes **f(x, y)**

pipes

### Summarise Cases

Apply **summary functions** to columns to create a new table of summary statistics. Summary functions take vectors as input and return one value (see back).

summary function

**summarise(.data, ...)**  
Compute table of summaries.  
summarise(mtcars, avg = mean(mpg))

**count(.data, ..., wt = NULL, sort = FALSE, name = NULL)** Count number of rows in each group defined by the variables in ... Also **tally()**.  
count(mtcars, cyl)

### Group Cases

Use **group\_by(.data, ..., .add = FALSE, .drop = TRUE)** to create a "grouped" copy of a table grouped by columns in ... dplyr functions will manipulate each "group" separately and combine the results.

mtcars %>%  
group\_by(cyl) %>%  
summarise(avg = mean(mpg))

### Manipulate Cases

#### EXTRACT CASES

Row functions return a subset of rows as a new table.

**filter(.data, ..., .preserve = FALSE)** Extract rows that meet logical criteria.  
filter(mtcars, mpg > 20)

**distinct(.data, ..., .keep\_all = FALSE)** Remove rows with duplicate values.  
distinct(mtcars, gear)

**slice(.data, ..., .preserve = FALSE)** Select rows by position.  
slice(mtcars, 10:15)

**slice\_sample(.data, ..., n, prop, weight\_by = NULL, replace = FALSE)** Randomly select rows. Use n to select a number of rows and prop to select a fraction of rows.  
slice\_sample(mtcars, n = 5, replace = TRUE)

**slice\_min(.data, order\_by, ..., n, prop, with\_ties = TRUE)** and **slice\_max()** Select rows with the lowest and highest values.  
slice\_min(mtcars, mpg, prop = 0.25)

**slice\_head(.data, ..., n, prop)** and **slice\_tail()** Select the first or last rows.  
slice\_head(mtcars, n = 5)

#### Logical and boolean operators to use with filter()

==	<	<=	is.na()	%in%		xor()
!=	>	>=	!is.na()	!	&	

See **?base::Logic** and **?Comparison** for help.

#### ARRANGE CASES

### Manipulate Variables

#### EXTRACT VARIABLES

Column functions return a set of columns as a new vector or table.

**pull(.data, var = -1, name = NULL, ...)** Extract column values as a vector, by name or index.  
pull(mtcars, wt)

**select(.data, ...)** Extract columns as a table.  
select(mtcars, mpg, wt)

**relocate(.data, ..., .before = NULL, .after = NULL)** Move columns to new position.  
relocate(mtcars, mpg, cyl, .after = last\_col())

#### Use these helpers with select() and across()

e.g. select(mtcars, mpg:cyl)

<b>contains(match)</b>	<b>num_range(prefix, range)</b>	;	e.g. mpg:cyl
<b>ends_with(match)</b>	<b>all_of(x)/any_of(x, ..., vars)</b>	-;	e.g. -gear
<b>starts_with(match)</b>	<b>matches(match)</b>		<b>everything()</b>

#### MANIPULATE MULTIPLE VARIABLES AT ONCE

**across(.cols, .funs, ..., .names = NULL)** Summarise or mutate multiple columns in the same way.  
summarise(mtcars, across(everything(), mean))

**c\_across(.cols)** Compute across columns in row-wise data.  
transmute(rowwise(UKgas), total = sum(c\_across(1:2)))

#### MAKE NEW VARIABLES

Apply **vectorized functions** to columns. Vectorized functions take vectors as input and return vectors of the same length as output (see back)

# What is wide/long data?

<https://github.com/gadenbuie/tidyexplain/blob/main/images/tidyr-pivoting.gif>

wide

id	x	y	z
1	a	c	e
2	b	d	f

# What is wide/long data?

Data is stored *differently* in the tibble.

Wide: has many columns

```
# A tibble: 1 × 4
  State    June_vacc_rate May_vacc_rate April_vacc_rate
  <chr>    <chr>          <chr>         <chr>
1 Alabama 37.2%          36.0%         32.4%
```

Long: column names become data

```
# A tibble: 3 × 3
  State    name          value
  <chr>    <chr>         <chr>
1 Alabama June_vacc_rate 37.2%
2 Alabama May_vacc_rate  36.0%
3 Alabama April_vacc_rate 32.4%
```

## What is wide/long data?

Wide: multiple columns per individual, values spread across multiple columns

```
# A tibble: 2 × 4
  State    June_vacc_rate May_vacc_rate April_vacc_rate
  <chr>    <chr>           <chr>         <chr>
1 Alabama 37.2%            36.0%         32.4%
2 Alaska 47.5%            46.2%         41.7%
```

Long: multiple rows per observation, a single column contains the values

```
# A tibble: 6 × 3
  State    name          value
  <chr>    <chr>          <chr>
1 Alabama June_vacc_rate 37.2%
2 Alabama May_vacc_rate  36.0%
3 Alabama April_vacc_rate 32.4%
4 Alaska  June_vacc_rate 47.5%
5 Alaska  May_vacc_rate  46.2%
6 Alaska  April_vacc_rate 41.7%
```

What is wide/long data?

Data is wide or long **with respect to** certain variables.

Wide

Long

	Day 1	Day 2	Day 3
Patient 1	A	B	C
Patient 2	D	E	F

	Day	Value
Patient 1	Day 1	A
Patient 1	Day 2	B
Patient 1	Day 3	C
Patient 2	Day 1	D
Patient 2	Day 2	E
Patient 2	Day 3	F

CC-BY jhudatascience.org

# Why do we need to switch between wide/long data?

Wide: **Easier for humans to read**

```
# A tibble: 2 × 4
  State    June_vacc_rate May_vacc_rate April_vacc_rate
  <chr>    <chr>           <chr>         <chr>
1 Alabama 37.2%           36.0%         32.4%
2 Alaska 47.5%           46.2%         41.7%
```

Long: **Easier for R to make plots & do analysis**

```
# A tibble: 6 × 3
  State    name          value
  <chr>    <chr>          <chr>
1 Alabama June_vacc_rate 37.2%
2 Alabama May_vacc_rate  36.0%
3 Alabama April_vacc_rate 32.4%
4 Alaska  June_vacc_rate 47.5%
5 Alaska  May_vacc_rate  46.2%
6 Alaska  April_vacc_rate 41.7%
```

## tidyr package

tidyr allows you to “tidy” your data. We will be talking about:

- `pivot_longer` - make multiple columns into variables, (wide to long)
- `pivot_wider` - make a variable into multiple columns, (long to wide)
- `separate` - string into multiple columns (review)

The `reshape` command exists. It is a **confusing** function. Don't use it.

**pivot\_longer...**

## Reshaping data from wide (fat) to long (tall): tidyr

`tidyr::pivot_longer` - puts column data into rows.

- First describe which columns we want to “pivot\_longer”
- `names_to` = gives a new name to the pivoted columns
- `values_to` = gives a new name to the values that used to be in those columns

```
{long_data} <- {wide_data} %>% pivot_longer(cols = {columns to pivot},  
                                             names_to = {New column name: contains old column names},  
                                             values_to = {New column name: contains cell values})
```

## Reshaping data from wide (fat) to long (tall): tidyr

wide\_data

```
# A tibble: 1 × 3
  June_vacc_rate May_vacc_rate April_vacc_rate
  <chr>          <chr>          <chr>
1 37.2%          36.0%          32.4%
```

```
long_data <- wide_data %>% pivot_longer(cols = everything(),
                                         names_to = "Month",
                                         values_to = "Rate")
```

long\_data

```
# A tibble: 3 × 2
  Month      Rate
  <chr>      <chr>
1 June_vacc_rate 37.2%
2 May_vacc_rate  36.0%
3 April_vacc_rate 32.4%
```

## Data used: Charm City Circulator

[http://jhudatascience.org/intro\\_to\\_r/data/Charm\\_City\\_Circulator\\_Ridership.csv](http://jhudatascience.org/intro_to_r/data/Charm_City_Circulator_Ridership.csv)

```
circ <- jhur::read_circulator()
head(circ, 5)
```

```
# A tibble: 5 × 15
```

	day	date	orangeBoardings	orangeAlightings	orangeAverage	purpleBoardings
	<chr>	<chr>	<dbl>	<dbl>	<dbl>	<dbl>
1	Monday	01/1...	877	1027	952	NA
2	Tuesday	01/1...	777	815	796	NA
3	Wednesday	01/1...	1203	1220	1212.	NA
4	Thursday	01/1...	1194	1233	1214.	NA
5	Friday	01/1...	1645	1643	1644	NA

```
# ... with 9 more variables: purpleAlightings <dbl>, purpleAverage <dbl>,
#   greenBoardings <dbl>, greenAlightings <dbl>, greenAverage <dbl>,
#   bannerBoardings <dbl>, bannerAlightings <dbl>, bannerAverage <dbl>,
#   daily <dbl>
```

## Reshaping data from wide (fat) to long (tall): tidyr

```
long <- circ %>%  
  pivot_longer(starts_with(c("orange", "purple", "green", "banner")),  
               names_to = "var",  
               values_to = "number")
```

long

```
# A tibble: 13,752 × 5
```

	day	date	daily	var	number
	<chr>	<chr>	<dbl>	<chr>	<dbl>
1	Monday	01/11/2010	952	orangeBoardings	877
2	Monday	01/11/2010	952	orangeAlightings	1027
3	Monday	01/11/2010	952	orangeAverage	952
4	Monday	01/11/2010	952	purpleBoardings	NA
5	Monday	01/11/2010	952	purpleAlightings	NA
6	Monday	01/11/2010	952	purpleAverage	NA
7	Monday	01/11/2010	952	greenBoardings	NA
8	Monday	01/11/2010	952	greenAlightings	NA
9	Monday	01/11/2010	952	greenAverage	NA
10	Monday	01/11/2010	952	bannerBoardings	NA

```
# ... with 13,742 more rows
```

## Reshaping data from wide (fat) to long (tall): tidyr

There are many ways to select the columns we want. Use `?tidyr_tidy_select` to look at more column selection options.

```
long <- circ %>%  
  pivot_longer( !c(day, date, daily),  
               names_to = "var",  
               values_to = "number")
```

long

```
# A tibble: 13,752 × 5  
   day    date    daily var          number  
   <chr> <chr>    <dbl> <chr>         <dbl>  
1 Monday 01/11/2010  952 orangeBoardings 877  
2 Monday 01/11/2010  952 orangeAlightings 1027  
3 Monday 01/11/2010  952 orangeAverage    952  
4 Monday 01/11/2010  952 purpleBoardings  NA  
5 Monday 01/11/2010  952 purpleAlightings  NA  
6 Monday 01/11/2010  952 purpleAverage    NA  
7 Monday 01/11/2010  952 greenBoardings   NA  
8 Monday 01/11/2010  952 greenAlightings  NA  
9 Monday 01/11/2010  952 greenAverage     NA  
10 Monday 01/11/2010  952 bannerBoardings  NA  
# ... with 13,742 more rows
```

## Reshaping data from wide (fat) to long (tall): tidyr

```
long %>% count(var)
```

```
# A tibble: 12 × 2
```

	var <chr>	n <int>
1	bannerAlightings	1146
2	bannerAverage	1146
3	bannerBoardings	1146
4	greenAlightings	1146
5	greenAverage	1146
6	greenBoardings	1146
7	orangeAlightings	1146
8	orangeAverage	1146
9	orangeBoardings	1146
10	purpleAlightings	1146
11	purpleAverage	1146
12	purpleBoardings	1146

## Cleaning up long data

We will use `str_replace` from the `stringr` package to put `_` in the names

```
long <- long %>% mutate(
  var = str_replace(var, "Board", "_Board"),
  var = str_replace(var, "Alight", "_Alight"),
  var = str_replace(var, "Average", "_Average")
)
long
```

# A tibble: 13,752 × 5

	day <chr>	date <chr>	daily <dbl>	var <chr>	number <dbl>
1	Monday	01/11/2010	952	orange_Boardings	877
2	Monday	01/11/2010	952	orange_Alightings	1027
3	Monday	01/11/2010	952	orange_Average	952
4	Monday	01/11/2010	952	purple_Boardings	NA
5	Monday	01/11/2010	952	purple_Alightings	NA
6	Monday	01/11/2010	952	purple_Average	NA
7	Monday	01/11/2010	952	green_Boardings	NA
8	Monday	01/11/2010	952	green_Alightings	NA
9	Monday	01/11/2010	952	green_Average	NA
10	Monday	01/11/2010	952	banner_Boardings	NA

# ... with 13,742 more rows

## Cleaning up long data

Now each `var` is Boardings, Averages, or Alightings. We use “`into =`” to name the new columns and “`sep =`” to show where the separation should happen.

```
long <- long %>%  
  separate(var, into = c("line", "type"), sep = "_")  
long
```

```
# A tibble: 13,752 × 6
```

	day <chr>	date <chr>	daily <dbl>	line <chr>	type <chr>	number <dbl>
1	Monday	01/11/2010	952	orange	Boardings	877
2	Monday	01/11/2010	952	orange	Alightings	1027
3	Monday	01/11/2010	952	orange	Average	952
4	Monday	01/11/2010	952	purple	Boardings	NA
5	Monday	01/11/2010	952	purple	Alightings	NA
6	Monday	01/11/2010	952	purple	Average	NA
7	Monday	01/11/2010	952	green	Boardings	NA
8	Monday	01/11/2010	952	green	Alightings	NA
9	Monday	01/11/2010	952	green	Average	NA
10	Monday	01/11/2010	952	banner	Boardings	NA

```
# ... with 13,742 more rows
```

**pivot\_wider...**

## ## Reshaping data from long (tall) to wide (fat): tidyr

`tidyr::pivot_wider` - spreads row data into columns.

- `names_from` = the old column whose contents will be spread into multiple new column names.
- `values_from` = the old column whose contents will fill in the values of those new columns.

```
{wide_data} <- {long_data} %>%  
  pivot_wider(names_from = {Old column name: contains new column names},  
              values_from = {Old column name: contains new cell values})
```

## Reshaping data from long (tall) to wide (fat): tidyr

long\_data

```
# A tibble: 3 × 2
  Month      Rate
<chr>      <chr>
1 June_vacc_rate 37.2%
2 May_vacc_rate  36.0%
3 April_vacc_rate 32.4%
```

```
wide_data <- long_data %>% pivot_wider(names_from = "Month",
                                       values_from = "Rate")
```

wide\_data

```
# A tibble: 1 × 3
  June_vacc_rate May_vacc_rate April_vacc_rate
<chr>          <chr>          <chr>

## Joining in `dplyr`

- Merging/joining data sets together - usually on key variables, usually "id"
- `?join` - see different types of joining for `dplyr`
- `inner_join(x, y)` - only rows that match for x and y are kept
- `full_join(x, y)` - all rows of x and y are kept
- `left_join(x, y)` - all rows of x are kept even if not merged with y
- `right_join(x, y)` - all rows of y are kept even if not merged with x
- `anti_join(x, y)` - all rows from x not in y keeping just columns from x.

# Merging: Simple Data

data\_As

```
# A tibble: 2 × 3
  State      June_vacc_rate May_vacc_rate
  <chr>      <chr>          <chr>
1 Alabama 37.2%          36.0%
2 Alaska 47.5%          46.2%
```

data\_cold

```
# A tibble: 2 × 2
  State      April_vacc_rate
  <chr>      <chr>
1 Maine 32.4%
2 Alaska 41.7%
```

# Inner Join

<https://github.com/gadenbuie/tidyexplain/blob/main/images/inner-join.gif>

`inner_join(x, y)`

## Inner Join

```
ij = inner_join(data_As, data_cold)
```

```
Joining, by = "State"
```

```
ij
```

```
# A tibble: 1 × 4
```

	State	June_vacc_rate	May_vacc_rate	April_vacc_rate
	<chr>	<chr>	<chr>	<chr>
1	Alaska	47.5%	46.2%	41.7%

# Left Join

<https://raw.githubusercontent.com/gadenbuie/tidyexplain/main/images/left-join.gif>

`left_join(x, y)`

## Left Join

```
lj = left_join(data_As, data_cold)
```

```
Joining, by = "State"
```

```
lj
```

```
# A tibble: 2 × 4
```

	State	June_vacc_rate	May_vacc_rate	April_vacc_rate
	<chr>	<chr>	<chr>	<chr>
1	Alabama	37.2%	36.0%	<NA>
2	Alaska	47.5%	46.2%	41.7%

## Install **tidylog** package to log outputs

```
# install.packages("tidylog")
library(tidylog)
left_join(data_As, data_cold)
```

```
Joining, by = "State"
left_join: added one column (April_vacc_rate)
> rows only in x 1
> rows only in y (1)
> matched rows 1
> ===
> rows total 2
```

```
# A tibble: 2 × 4
  State      June_vacc_rate May_vacc_rate April_vacc_rate
  <chr>      <chr>          <chr>          <chr>
1 Alabama  37.2%           36.0%          <NA>
2 Alaska   47.5%           46.2%          41.7%
```

## Right Join

<https://raw.githubusercontent.com/gadenbuie/tidyexplain/main/images/right-join.gif>

`right_join(x, y)`

## Right Join

```
rj <- right_join(data_As, data_cold)
```

```
Joining, by = "State"
```

```
right_join: added one column (April_vacc_rate)
```

```
> rows only in x (1)
```

```
> rows only in y 1
```

```
> matched rows 1
```

```
> ===
```

```
> rows total 2
```

```
rj
```

```
# A tibble: 2 × 4
```

	State	June_vacc_rate	May_vacc_rate	April_vacc_rate
	<chr>	<chr>	<chr>	<chr>
1	Alaska	47.5%	46.2%	41.7%
2	Maine	<NA>	<NA>	32.4%

## Left Join: Switching arguments

```
lj2 <- left_join(data_cold, data_As)
```

```
Joining, by = "State"  
left_join: added 2 columns (June_vacc_rate, May_vacc_rate)  
> rows only in x 1  
> rows only in y (1)  
> matched rows 1  
> ===  
> rows total 2
```

```
lj2
```

```
# A tibble: 2 × 4  
  State April_vacc_rate June_vacc_rate May_vacc_rate  
  <chr>   <chr>           <chr>         <chr>  
1 Maine  32.4%           <NA>         <NA>  
2 Alaska 41.7%           47.5%        46.2%
```

# Full Join

<https://raw.githubusercontent.com/gadenbuie/tidyexplain/main/images/full-join.gif>

`full_join(x, y)`

# FullJoin

```
fj <- full_join(data_As, data_cold)
```

```
Joining, by = "State"
```

```
full_join: added one column (April_vacc_rate)
```

```
> rows only in x 1
```

```
> rows only in y 1
```

```
> matched rows 1
```

```
> ===
```

```
> rows total 3
```

# Full Join

fj

```
# A tibble: 3 × 4
```

	State	June_vacc_rate	May_vacc_rate	April_vacc_rate
	<chr>	<chr>	<chr>	<chr>
1	Alabama	37.2%	36.0%	<NA>
2	Alaska	47.5%	46.2%	41.7%
3	Maine	<NA>	<NA>	32.4%

## Watch out for “includes duplicates”

data\_As

```
# A tibble: 2 × 2
  State    state_bird
  <chr>    <chr>
1 Alabama wild turkey
2 Alaska  willow ptarmigan
```

data\_cold

```
# A tibble: 3 × 3
  State    vacc_rate month
  <chr>    <chr>    <chr>
1 Maine  32.4%    April
2 Alaska 41.7%    April
3 Alaska 46.2%    May
```

## Watch out for “includes duplicates”

```
lj <- left_join(data_As, data_cold)
```

```
Joining, by = "State"  
left_join: added 2 columns (vacc_rate, month)  
> rows only in x 1  
> rows only in y (1)  
> matched rows 2 (includes duplicates)  
> ===  
> rows total 3
```

## Watch out for “includes duplicates”

Data including the joining column (“State”) has been duplicated.

lj

```
# A tibble: 3 × 4
  State    state_bird      vacc_rate month
  <chr>    <chr>          <chr>    <chr>
1 Alabama wild turkey    <NA>     <NA>
2 Alaska  willow ptarmigan 41.7%    April
3 Alaska  willow ptarmigan 46.2%    May
```

Note that “Alaska willow ptarmigan” appears twice.

## Watch out for “includes duplicates”

<https://github.com/gadenbuie/tidyexplain/blob/main/images/left-join-extra.gif>

`left_join(x, y)`

## Stop tidylog

```
unloadNamespace("tidylog")
```

# Duplicated

- The `uplicated` function can give you indications if there are duplicates in a **vector**:

```
duplicated(1:5)
```

```
[1] FALSE FALSE FALSE FALSE FALSE
```

```
duplicated(c(1:5, 1))
```

```
[1] FALSE FALSE FALSE FALSE FALSE TRUE
```

```
lj %>% mutate(dup_State = duplicated(State))
```

```
# A tibble: 3 × 5
```

	State	state_bird	vacc_rate	month	dup_State
	<chr>	<chr>	<chr>	<chr>	<lgl>
1	Alabama	wild turkey	<NA>	<NA>	FALSE
2	Alaska	williow ptarmigan	41.7%	April	FALSE
3	Alaska	williow ptarmigan	46.2%	May	TRUE

## Using the **by** argument

By default joins use the intersection of column names. If **by** is specified, it uses that.

```
full_join(data_As, data_cold, by = "State")
```

```
# A tibble: 4 × 4
  State    state_bird      vacc_rate month
  <chr>    <chr>          <chr>    <chr>
1 Alabama wild turkey    <NA>     <NA>
2 Alaska willow ptarmigan 41.7%    April
3 Alaska willow ptarmigan 46.2%    May
4 Maine   <NA>           32.4%    April
```

## Using the **by** argument

You can join based on multiple columns by using something like `by = c(col1, col2)`.

If the datasets have two different names for the same data, use:

```
full_join(data_As, data_cold, by = c("a" = "b"))
```

## Using “setdiff”

We might want to determine what indexes ARE in the first dataset that AREN'T in the second:

```
data_As
```

```
# A tibble: 2 × 2
  State    state_bird
  <chr>    <chr>
1 Alabama wild turkey
2 Alaska  willow ptarmigan
```

```
data_cold
```

```
# A tibble: 3 × 3
  State    vacc_rate month
  <chr>    <chr>    <chr>
1 Maine  32.4%    April
2 Alaska 41.7%    April
3 Alaska 46.2%    May
```

## Using “`setdiff`”

Use `setdiff` to determine what indexes ARE in the first dataset that AREN'T in the second:

```
A_states <- data_As %>% pull(State)
cold_states <- data_cold %>% pull(State)
```

```
setdiff(A_states, cold_states)
```

```
[1] "Alabama"
```

```
setdiff(cold_states, A_states)
```

```
[1] "Maine"
```
