# Subsetting Data in R

#### Overview

In this module, we will show you how to:

- 1. Look at your data in different ways
- 2. Create a data frame and a tibble
- 3. Create new variables/make rownames a column
- 4. Rename columns of a data frame
- 5. Subset rows of a data frame
- 6. Subset columns of a data frame
- 7. Add/remove new columns to a data frame
- 8. Order the columns of a data frame
- 9. Order the rows of a data frame

### Setup

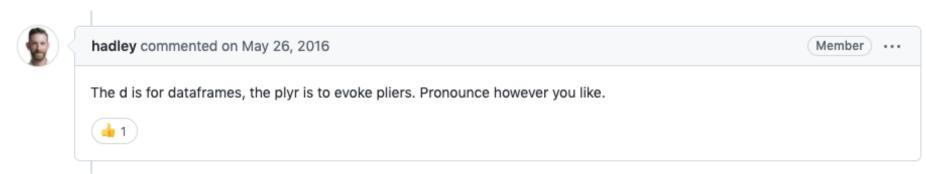

We will largely focus on the dplyr package which is part of the tidyverse.

#### Some resources on how to use dplyr:

- https://dplyr.tidyverse.org/
- https://cran.r-project.org/web/packages/dplyr/vignettes/dplyr.html
- https://www.opencasestudies.org/

### Why dplyr?

The dplyr package is one of the most helpful packages for altering your data to get it into a form that is useful for creating visualizations, summarizing, or more deeply analyzing.

So you can imagine using pliers on your data.

### Loading in dplyr and tidyverse

See this website for a list of the packages included in the tidyverse: https://www.tidyverse.org/packages/

library(tidyverse) # loads dplyr and other packages!

### Getting data to work with

Here we use one of the datasets that comes with base R called mtcars. We will now create a toy data frame named df using this data. This way we can alter df without worrying about changing mtcars.

```
df <- mtcars # df is a copy of mtcars
head(df) # changing df does **not** change mtcars!</pre>
```

	mpg	cyl	disp	hp	drat	wt	qsec	VS	am	gear	carb
Mazda RX4	21.0	6	160	110	3.90	2.620	16.46	0	1	4	4
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875	17.02	0	1	4	4
Datsun 710	22.8	4	108	93	3.85	2.320	18.61	1	1	4	1
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3	1
Hornet Sportabout	18.7	8	360	175	3.15	3.440	17.02	0	0	3	2
Valiant	18.1	6	225	105	2.76	3.460	20.22	1	0	3	1

## Checking the data dim()

The dim(), nrow(), and ncol() functions are good options to check the dimensions of your data before moving forward.

```
dim(df) # rows, columns

[1] 32 11

nrow(df) # number of rows

[1] 32

ncol(df) # number of columns

[1] 11
```

## Checking the data: glimpse()

glimpse(df)

In addition to head() and tail(), the glimpse() function of the dplyr package is another great function to look at your data.

### Checking your data: slice\_sample()

What if you want to see the middle of your data? You can use the slice\_sample() function of the dplyr package to see a random set of rows. You can specify the number of rows with the n argument or use a proportion with the prop argument.

```
slice_sample(df, n = 3)

mpg cyl disp hp drat wt qsec vs am gear carb
Hornet 4 Drive 21.4 6 258.0 110 3.08 3.215 19.44 1 0 3 1
Honda Civic 30.4 4 75.7 52 4.93 1.615 18.52 1 1 4 2
Pontiac Firebird 19.2 8 400.0 175 3.08 3.845 17.05 0 0 3 2

slice_sample(df, prop = .2)
```

Fiat 128	32.4	4	78.7	66	4.08	2.200	19.47	1	1	4	1

### Keep in mind...

Need to assign the output of the function to keep the result!

```
df_updated <-data.frame(df)
# this would overwrite the existing df object
df<-data.frame(df)</pre>
```

### Or create a data frame when reading in the file

Or directly when reading in a csv with the read.csv() function (also base R)

```
# function comes from base R - no package loading required
df_example_readr <- read.csv("documents/data_analysis/data_file.csv")</pre>
```

### tibble

We can create a **fancier** version of the previous data frame which can be really helpful.

### Creating a tibble

tbl <- dplyr::tibble(df)</pre>

If we would like to create a tibble ("fancy" data frame), we can using the tibble() function.

```
tbl
# A tibble: 32 × 11
                                                                                                                                                                  wt qsec
                                                 cyl disp
                                                                                                            hp drat
                      mpg
                                                                                                                                                                                                                         VS
                                                                                                                                                                                                                                                     am
                                                                                                                                                                                                                                                                      gear
                                                                                                                                                                                                                                                                                                  carb
              <dbl> <
                                                                                                        110 3.9
                                                                                                                                                         2.62
                                                                                                                                                                                    16.5
              21
                                                          6
                                                                        160
                                                                                                                                                                                                                                                                                     4
                                                                                                                                                                                                                                                                                                               4
               21
                                                                                                       110 3.9
                                                                                                                                                         2.88
                                                                       160
                                                                                                                                                                                  17.0
                                                                                                                                                                                                                                                                                    4
                                                                                                                                                                                                                                                                                                               4

                                                                                                                                                                                                                                                                                     4
                                                                                                                                                                                                                                                                                                                4
# ... with 22 more rows
```

Note don't necessarily need to use head()- tibbles conveniently print a portion of the data.

### tibbles form read\_csv()

Alternatively we can read data files using the tidyverse with the read\_csv() function of the readr package from the tidyverse to make a tibble.

```
df_example_readr <- read_csv("documents/data_analysis/data_file.csv")</pre>
```

You may start to notice how the tidyverse package work well together!

### Summary of tibbles and data frames

#### Base R:

Using read.csv() and data.frame() you can make data frames

Tidyverse (fancier version):

Using read\_csv() and tibble() you can make tibbles

We generally recommend using tibbles, but you can do a lot with tibbles too.

### Data frames vs tibbles

In the "tidy" data format, rownames are removed. For example, df has each car name as a row name. Here we use the head() function to see the first 2 rows of each. In this case we would want to make the rownames a new column first before making into a tibble.

```
head(df, 2)
                                                                                    mpg cyl disp hp drat wt gsec vs am gear carb

### rownames\_to\_column function

If you run into losing a variable contained in your row names, you can also use rownames\_to\_column to add it before turning it into a tibble to keep them:

```
head(rownames to column(df, var = "car"), 2)
         car mpg cyl disp hp drat wt qsec vs am gear carb
    Mazda RX4 21
               6 160 110 3.9 2.620 16.46 0 1
1
2 Mazda RX4 Wag 21 6 160 110 3.9 2.875 17.02 0 1
head(tibble(rownames_to_column(df, var = "car")), 2)
# A tibble: 2 \times 12
                 cvl disp
                           hp drat
                                     wt asec
 car
             mpg

                              3.9 2.88 17.0
                                               0
```

# **Renaming Columns**

### Renaming Columns of a data frame or tibble

To rename columns in dplyr, you can use the rename function.

For example, let's rename mpg to MPG. Notice the new name is listed first!

```
# general format! not code!
{data you are creating or changing} <- rename({data you are using},
                                 {New Name} = {Old name})
df <- dplyr::rename(df, MPG = mpg)</pre>
head(df)
               MPG cyl disp hp drat wt gsec vs am gear carb
Mazda RX4
              21.0 6 160 110 3.90 2.620 16.46 0 1
Mazda RX4 Wag
            21.0 6 160 110 3.90 2.875 17.02 0 1
         Datsun 710
                                                       1
Hornet 4 Drive 21.4 6 258 110 3.08 3.215 19.44 1 0
                                                       1
Hornet Sportabout 18.7 8 360 175 3.15 3.440 17.02 0 0 3
              18.1 6 225 105 2.76 3.460 20.22 1 0 3
Valiant
```

### Renaming All Columns of a data frame: dplyr

To rename all columns you use the rename\_all(). In this case we will use toupper() to make all letters upper case. Could also use tolower() function.

```
df upper <- dplyr::rename all(df, toupper)</pre>
head(df_upper, 3)
             MPG CYL DISP HP DRAT
                                    WT QSEC VS AM GEAR CARB
Mazda RX4
             21.0
                   6 160 110 3.90 2.620 16.46 0 1
Mazda RX4 Wag 21.0 6 160 110 3.90 2.875 17.02 0 1
Datsun 710
            22.8
                   4 108 93 3.85 2.320 18.61 1 1
                                                          1
df <- dplyr::rename all(df, tolower)</pre>
head(df, 3)
             mpg cyl disp hp drat wt gsec vs am gear carb
Mazda RX4
             21.0
                   6 160 110 3.90 2.620 16.46 0 1
Mazda RX4 Wag 21.0 6 160 110 3.90 2.875 17.02 0 1
Datsun 710
             22.8
                   4 108 93 3.85 2.320 18.61 1 1
```

### Lab Part 1

#### Website

# **Subsetting Columns**

### Subset columns of a data frame:

We can grab the carb column using the \$ operator. This is the base R way to do this:

df\$carb

[1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2

### Subset columns of a data frame - tidyverse way:

To grab the carb column the tidyverse way we can use the pull function:

```
pull(df, carb)
```

[1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2

The select command from dplyr allows you to subset (gives a tibble!)

select(df, mpg)

	mpg
Mazda RX4	21.0
Mazda RX4 Wag	21.0
Datsun 710	22.8
Hornet 4 Drive	21.4
Hornet Sportabout	18.7
Valiant	18.1
Duster 360	14.3
Merc 240D	24.4
Merc 230	22.8
Merc 280	19.2
Merc 280C	17.8
Merc 450SE	16.4
Merc 450SL	17.3
Merc 450SLC	15.2
Cadillac Fleetwood	10.4
Lincoln Continental	10.4
Chrysler Imperial	14.7
Fiat 128	32.4
Honda Civic	30.4

Note that if you want a single vector (not a tibble), use pull or \$:

```
pull(df, mpg)

[1] 21.0 21.0 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 17.8 16.4 17.3 15.2 10.4
[16] 10.4 14.7 32.4 30.4 33.9 21.5 15.5 15.2 13.3 19.2 27.3 26.0 30.4 15.8 19.7
[31] 15.0 21.4

# pull with select works too!

pull(select(df,mpg))

[1] 21.0 21.0 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 17.8 16.4 17.3 15.2 10.4
[16] 10.4 14.7 32.4 30.4 33.9 21.5 15.5 15.2 13.3 19.2 27.3 26.0 30.4 15.8 19.7
[31] 15.0 21.4
```

## Select columns of a data frame: dplyr

The select command from dplyr allows you to subset columns matching strings:

select(df, mpg, cyl)

	mpg	cyl
Mazda RX4	21.0	6
Mazda RX4 Wag	21.0	6
Datsun 710	22.8	4
Hornet 4 Drive	21.4	6
Hornet Sportabout	18.7	8
Valiant	18.1	6
Duster 360	14.3	8
Merc 240D	24.4	4
Merc 230	22.8	4
Merc 280	19.2	6
Merc 280C	17.8	6
Merc 450SE	16.4	8
Merc 450SL	17.3	8
Merc 450SLC	15.2	8
Cadillac Fleetwood	10.4	8
Lincoln Continental	10.4	8
Chrysler Imperial	14.7	8
Fiat 128	32.4	4

## See the Select "helpers"

Here are a few:

```
one_of() # if they exist
last_col()
ends_with()
contains() # like searching
```

Type tidyselect:: in the console and see what RStudio suggests:

tidyslect::

### Lab Part 2

Website

# **Subsetting Rows**

The command in dplyr for subsetting rows is filter.

```
filter(df, mpg > 20)
```

```
mpg cvl
                       disp hp drat
                                       wt gsec vs am gear carb
Mazda RX4
              21.0
                    6 160.0 110 3.90 2.620 16.46 0
Mazda RX4 Wag 21.0
                    6 160.0 110 3.90 2.875 17.02 0 1
Datsun 710
              22.8
                    4 108.0 93 3.85 2.320 18.61 1 1
Hornet 4 Drive 21.4
                    6 258.0 110 3.08 3.215 19.44 1 0
                                                             1
Merc 240D
              24.4
                    4 146.7 62 3.69 3.190 20.00 1
                                                             2
Merc 230
             22.8
                    4 140.8 95 3.92 3.150 22.90 1
Fiat 128
             32.4
                    4 78.7 66 4.08 2.200 19.47 1 1
                                                             1
Honda Civic
              30.4
                    4 75.7 52 4.93 1.615 18.52 1
Toyota Corolla 33.9
                    4 71.1 65 4.22 1.835 19.90 1
                                                             1
Toyota Corona 21.5
                    4 120.1 97 3.70 2.465 20.01 1
                                                             1
Fiat X1-9
              27.3
                    4 79.0 66 4.08 1.935 18.90 1
                                                             1
Porsche 914-2 26.0
                    4 120.3 91 4.43 2.140 16.70 0
Lotus Europa
              30.4
                    4 95.1 113 3.77 1.513 16.90 1
Volvo 142E
              21.4
                    4 121.0 109 4.11 2.780 18.60 1
```

Note, no \$ or subsetting is necessary. R "knows" mpg refers to a column of df.

You can have multiple logical conditions using the following:

- · ==: equals to
- !=: not equal to (!: not/negation)
- · > / <: greater than / less than
- >= or <=: greater than or equal to / less than or equal to</li>
- · &: AND
- · |: OR

The %in% operator can be used find values from a pre-made list (using c()):

```
filter(df, mpg %in% c(20,21,22))
```

```
mpg cyl disp hp drat wt qsec vs am gear carb
Mazda RX4 21 6 160 110 3.9 2.620 16.46 0 1 4 4
Mazda RX4 Wag 21 6 160 110 3.9 2.875 17.02 0 1 4 4
```

You can filter by two conditions using & or commas:

```
filter(df, mpg > 20 \& cyl == 4)
```

```
mpg cyl disp hp drat wt gsec vs am gear carb
Datsun 710
             22.8
                    4 108.0 93 3.85 2.320 18.61
                                                           1
Merc 240D
             24.4
                    4 146.7 62 3.69 3.190 20.00 1 0
Merc 230
            22.8
                    4 140.8 95 3.92 3.150 22.90 1 0
Fiat 128
         32.4
                    4 78.7 66 4.08 2.200 19.47 1 1
                                                           1
Honda Civic
             30.4
                    4 75.7 52 4.93 1.615 18.52 1
Toyota Corolla 33.9
                    4 71.1 65 4.22 1.835 19.90 1
                                                           1
Toyota Corona 21.5
                    4 120.1 97 3.70 2.465 20.01 1 0
                                                           1
Fiat X1-9
             27.3
                    4 79.0 66 4.08 1.935 18.90 1
                                                           1
                                                 1
Porsche 914-2 26.0
                    4 120.3 91 4.43 2.140 16.70 0 1
Lotus Europa
             30.4
                    4 95.1 113 3.77 1.513 16.90 1
Volvo 142E
             21.4
                    4 121.0 109 4.11 2.780 18.60 1 1
```

filter(df, mpg > 20, cyl == 4)

#### Subset rows of a data frame: dplyr

If you want OR statements (meaning the data can meet either condition does not need to meet both), you need to use the pipe | between conditions:

```
filter(df, mpg > 20 | cyl == 4)
```

```
mpg cyl disp hp drat
                                     wt gsec vs am gear carb
Mazda RX4
              21.0
                    6 160.0 110 3.90 2.620 16.46 0
Mazda RX4 Wag
              21.0
                    6 160.0 110 3.90 2.875 17.02 0 1
                                                             4
Datsun 710
                    4 108.0 93 3.85 2.320 18.61 1 1
              22.8
Hornet 4 Drive 21.4
                    6 258.0 110 3.08 3.215 19.44 1
                                                             1
Merc 240D

                                                             2
```

#### Lab Part 3

Website

#### Combining filter and select

You can combine filter and select to subset the rows and columns, respectively, of a data frame:

```
select(filter(df, mpg > 20 \& cyl == 4), cyl, hp)
```

	cyl	hp
Datsun 710	4	93
Merc 240D	4	62
Merc 230	4	95
Fiat 128	4	66
Honda Civic	4	52
Toyota Corolla	4	65
Toyota Corona	4	97
Fiat X1-9	4	66
Porsche 914-2	4	91
Lotus Europa	4	113
Volvo 142E	4	109

In R, the common way to perform multiple operations is to wrap functions around each other in a nested way such as above.

#### **Assigning Temporary Objects**

One can also create temporary objects and reassign them:

#### Using the pipe (comes with dplyr):

Recently, the pipe %>% makes things such as this much more readable. It reads left side "pipes" into right side. RStudio CMD/Ctrl + Shift + M shortcut. Pipe df into filter, then pipe that into select:

```
df \%% filter(mpg > 20 & cyl == 4) %>% select(cyl, hp)
```

	суТ	hp
Datsun 710	4	93
Merc 240D	4	62
Merc 230	4	95
Fiat 128	4	66
Honda Civic	4	52
Toyota Corolla	4	65
Toyota Corona	4	97
Fiat X1-9	4	66
Porsche 914-2	4	91
Lotus Europa	4	113
Volvo 142E	4	109

# Adding/Removing Columns

#### Adding new columns to a data frame: base R

You can add a new column, called **newcol** to **df**, using the \$ operator:

```
df$newcol <- df$wt/2.2
head(df,3)</pre>
```

```
mpg cyl disp hp drat wt qsec vs am gear carb newcol Mazda RX4 21.0 6 160 110 3.90 2.620 16.46 0 1 4 4 1.190909 Mazda RX4 Wag 21.0 6 160 110 3.90 2.875 17.02 0 1 4 4 1.306818 Datsun 710 22.8 4 108 93 3.85 2.320 18.61 1 1 4 1 1.054545
```

# Adding columns to a data frame: dplyr (tidyverse way)

The \$ method is very common.

The mutate function in dplyr allows you to add or modify columns of a data frame.

#### Removing columns of a data frame: base R

You can remove a column by assigning to **NULL**:

df\$newcol <- NULL

#### Removing columns of a data frame: dplyr

The **NULL** method is still very common.

The select function can remove a column with minus (-):

```
select(df, - newcol)
```

	mpg	cyl	disp	hp	drat	wt	qsec	VS	am	gear	carb
Mazda RX4	21.0	6	160	110	3.90	2.620	16.46	0	1	4	4
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875	17.02	0	1	4	4
Datsun 710	22.8	4	108	93	3.85	2.320	18.61	1	1	4	1
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3	1
Hornet Sportabout	18.7	8	360	175	3.15	3.440	17.02	0	0	3	2
Valiant	18.1	6	225	105	2.76	3.460	20.22	1	0	3	1

Or, you can simply select the columns you want to keep, ignoring the ones you want to remove.

## Removing columns to a data frame: dplyr

You can use c() to list the columns to remove.

#### Remove newcol and drat:

```
select(df, -c("newcol", "drat"))
```

	mpg	cyl	disp	hp	wt	qsec	VS	am	gear	carb
Mazda RX4	21.0	6	160.0	110	2.620	16.46	0	1	4	4

# Ordering columns

## Ordering the columns of a data frame: dplyr

The select function can reorder columns.

```
head(df)
select(df, cyl, mpg, wt, car) %>%
head()
```

#### Ordering the columns of a data frame: dplyr

We can also use the relocate() function of dplyr to rearrange the columns.

For example, let say we just wanted wt to be first.

head(df)

```
mpg cyl disp hp drat wt qsec vs am gear carb
                                                               newcol
Mazda RX4
                21.0
                      6 160 110 3.90 2.620 16.46 0 1
                                                           4 1.190909
               21.0 6 160 110 3.90 2.875 17.02 0 1
Mazda RX4 Wag
                                                           4 1.306818
           22.8 4 108 93 3.85 2.320 18.61 1 1

# Ordering rows

## Ordering the rows of a data frame: dplyr

The arrange function can reorder rows By default, arrange orders in ascending order:

arrange(df, mpg)

	mpg	cyl	disp	hp	drat	wt	qsec	VS	am	gear	carb
Cadillac Fleetwood	10.4	8	472.0	205	2.93	5.250	17.98	0	0	3	4
Lincoln Continental	10.4	8	460.0	215	3.00	5.424	17.82	0	0	3	4
Camaro Z28	13.3	8	350.0	245	3.73	3.840	15.41	0	0	3	4
Duster 360	14.3	8	360.0	245	3.21	3.570	15.84	0	0	3	4
Chrysler Imperial	14.7	8	440.0	230	3.23	5.345	17.42	0	0	3	4
Maserati Bora	15.0	8	301.0	335	3.54	3.570	14.60	0	1	5	8
Merc 450SLC	15.2	8	275.8	180	3.07	3.780	18.00	0	0	3	3
AMC Javelin	15.2	8	304.0	150	3.15	3.435	17.30	0	0	3	2
Dodge Challenger	15.5	8	318.0	150	2.76	3.520	16.87	0	0	3	2
Ford Pantera L	15.8	8	351.0	264	4.22	3.170	14.50	0	1	5	4
Merc 450SE	16.4	8	275.8	180	3.07	4.070	17.40	0	0	3	3
Merc 450SL	17.3	8	275.8	180	3.07	3.730	17.60	0	0	3	3
Merc 280C	17.8	6	167.6	123	3.92	3.440	18.90	1	0	4	4
Valiant	18.1	6	225.0	105	2.76	3.460	20.22	1	0	3	1
Hornet Sportabout	18.7	8	360.0	175	3.15	3.440	17.02	0	0	3	2
Merc 280	19.2	6	167.6	123	3.92	3.440	18.30	1	0	4	4
Pontiac Firebird	19.2	8	400.0	175	3.08	3.845	17.05	0	0	3	2
Ferrari Dino	19.7	6	145.0	175	3.62	2.770	15.50	0	1	5	6

## Ordering the rows of a data frame: dplyr

Use the desc to arrange the rows in descending order:

arrange(df, desc(mpg))

	mpg	cyl	disp	hp	drat	wt	qsec	VS	am	gear	carb
Toyota Corolla	33.9	4	71.1	65	4.22	1.835	19.90	1	1	4	1
Fiat 128	32.4	4	78.7	66	4.08	2.200	19.47	1	1	4	1
Honda Civic	30.4	4	75.7	52	4.93	1.615	18.52	1	1	4	2
Lotus Europa	30.4	4	95.1	113	3.77	1.513	16.90	1	1	5	2
Fiat X1-9	27.3	4	79.0	66	4.08	1.935	18.90	1	1	4	1
Porsche 914-2	26.0	4	120.3	91	4.43	2.140	16.70	0	1	5	2
Merc 240D	24.4	4	146.7	62	3.69	3.190	20.00	1	0	4	2
Datsun 710	22.8	4	108.0	93	3.85	2.320	18.61	1	1	4	1
Merc 230	22.8	4	140.8	95	3.92	3.150	22.90	1	0	4	2
Toyota Corona	21.5	4	120.1	97	3.70	2.465	20.01	1	0	3	1
Hornet 4 Drive	21.4	6	258.0	110	3.08	3.215	19.44	1	0	3	1
Volvo 142E	21.4	4	121.0	109	4.11	2.780	18.60	1	1	4	2
Mazda RX4	21.0	6	160.0	110	3.90	2.620	16.46	0	1	4	4
Mazda RX4 Wag	21.0	6	160.0	110	3.90	2.875	17.02	0	1	4	4
Ferrari Dino	19.7	6	145.0	175	3.62	2.770	15.50	0	1	5	6
Merc 280	19.2	6	167.6	123	3.92	3.440	18.30	1	0	4	4
Pontiac Firebird	19.2	8	400.0	175	3.08	3.845	17.05	0	0	3	2
Hornet Sportabout	18.7	8	360.0	175	3.15	3.440	17.02	0	0	3	2
Valiant	18.1	6	225.0	105	2.76	3.460	20.22	1	0	3	1

## Ordering the rows of a data frame: dplyr

Increasing and decreasing orderings:

```
arrange(df, mpg, desc(hp))
```

	mpg	cyl	disp	hp	drat	wt	qsec	VS	am	gear	carb
Lincoln Continental	10.4	8	460.0	215	3.00	5.424	17.82	0	0	3	4
Cadillac Fleetwood	10.4	8	472.0	205	2.93	5.250	17.98	0	0	3	4
Camaro Z28	13.3	8	350.0	245	3.73	3.840	15.41	0	0	3	4
Duster 360	14.3	8	360.0	245	3.21	3.570	15.84	0	0	3	4
Chrysler Imperial	14.7	8	440.0	230	3.23	5.345	17.42	0	0	3	4
Maserati Bora	15.0	8	301.0	335	3.54	3.570	14.60	0	1	5	8
Merc 450SLC	15.2	8	275.8	180	3.07	3.780	18.00	0	0	3	3
AMC Javelin	15.2	8	304.0	150	3.15	3.435	17.30	0	0	3	2
Dodge Challenger	15.5	8	318.0	150	2.76	3.520	16.87	0	0	3	2
Ford Pantera L	15.8	8	351.0	264	4.22	3.170	14.50	0	1	5	4

#### Lab Part 4

Website

## **Extra Slides**

#### Creating conditional variables

One frequently-used tool is creating variables with conditions.

A general function for creating new variables based on existing variables is the ifelse() function, which "returns a value depending on whether the element of test is TRUE or FALSE."

```
ifelse(test, yes, no)

# test: an object which can be coerced
    to logical mode.

# yes: return values for true elements of test.
# no: return values for false elements of test.
```

#### ifelse example

```
df$disp
 [1] 160.0 160.0 108.0 258.0 360.0 225.0 360.0 146.7 140.8 167.6 167.6 275.8
[13] 275.8 275.8 472.0 460.0 440.0 78.7 75.7 71.1 120.1 318.0 304.0 350.0
[25] 400.0 79.0 120.3 95.1 351.0 145.0 301.0 121.0
Now with ifelse()
#ifelse(test, yes, no)
ifelse(df$disp <= 200, "low", "high")</pre>
 [1] "low" "low" "low" "high" "high" "high" "high" "low" "low" "low"
[11] "low" "high" "high" "high" "high" "high" "low" "low" "low"
[21] "low" "high" "high" "high" "low" "low" "low" "high" "low"
[31] "high" "low"
```

#### Adding columns to a data frame: dplyr

Combined with ifelse(condition, TRUE, FALSE), it can give you:

#### Adding columns to a data frame: dplyr

Alternatively, case\_when provides a clean syntax as well:

#### Renaming Columns of a data frame: base R

We can use the colnames function to extract and/or directly reassign column names of df:

```
colnames(df) # just prints
             "cyl"
                          "disp"
                                      "hp"
                                                 "drat"
                                                            "wt"
 [1] "mpg"
               "VS"
                                      "gear"
                                                 "carb"
 [7] "qsec"
                           "am"
                                                            "newcol"
[13] "disp cat" "disp cat2"
colnames(df)[1:3] = c("MPG", "CYL", "DISP") # reassigns

#### Subset rows of a data frame with indices:

Let's select **rows** 1 and 3 from **df** using brackets:

```
df[ c(1, 3), ]

mpg cyl disp hp drat wt qsec vs am gear carb newcol disp_cat

Mazda RX4 21.0 6 160 110 3.90 2.62 16.46 0 1 4 4 1.190909 Low

Datsun 710 22.8 4 108 93 3.85 2.32 18.61 1 1 4 1 1.054545 Low

disp_cat2

Mazda RX4 Low

Datsun 710 Low
```

#### Subset columns of a data frame:

We can also subset a data frame using the bracket [, ] subsetting.

For data frames and matrices (2-dimensional objects), the brackets are [rows, columns] subsetting. We can grab the x column using the index of the column or the column name ("carb")

```
df[, 11]
[1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2
df[, "carb"]
[1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2
```

#### Biggest difference between tbl and data frame:

Mostly, tbl (tibbles) are the same as data frames, except they don't print all lines. When subsetting only one column using brackets, a data frame will return a vector, but a tbl will return a tbl

```
df[, 1]
 [1] 21.0 21.0 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 17.8 16.4 17.3 15.2 10.4
[16] 10.4 14.7 32.4 30.4 33.9 21.5 15.5 15.2 13.3 19.2 27.3 26.0 30.4 15.8 19.7
[31] 15.0 21.4
tbl[, 1]
# A tibble: 32 × 1
    mpg
   <dbl>
 1 21
 2 21
 3 22.8
 4 21.4
 5 18.7
 6 18.1
```

14.3

#### Subset columns of a data frame:

We can select multiple columns using multiple column names:

```
df[, c("mpg", "cyl")]
```

	mpg	cyl
Mazda RX4	21.0	6
Mazda RX4 Wag	21.0	6
Datsun 710	22.8	4
Hornet 4 Drive	21.4	6
Hornet Sportabout	18.7	8
Valiant	18.1	6
Duster 360	14.3	8
Merc 240D	24.4	4
Merc 230	22.8	4
Merc 280	19.2	6
Merc 280C	17.8	6
Merc 450SE	16.4	8
Merc 450SL	17.3	8
Merc 450SLC	15.2	8
Cadillac Fleetwood	10.4	8
Lincoln Continental	10.4	8
Chrysler Imperial	14.7	8
Fiat 128	32.4	4
Honda Civic	30.4	4
