Data Summarization

Data Summarization

- Basic statistical summarization
 - mean(x): takes the mean of x
 - sd(x): takes the standard deviation of x
 - median(x): takes the median of x
 - quantile(x): displays sample quantiles of x. Default is min, IQR, max
 - range(x): displays the range. Same as c(min(x), max(x))
 - sum(x): sum of x
 - max(x): maximum value in x
 - min(x): minimum value in x
 - all have a na.rm for missing data
- Transformations
 - log log (base e) transformation
 - log10 log base 10 transform
 - sqrt square root

The vector getting summarized goes inside the parentheses:

```
x <- c(1, 5, 7, 4, 2, 8)
mean(x)

[1] 4.5

range(x)

[1] 1 8

sum(x)</pre>
```

Note that many of these functions have additional inputs regarding missing data, typically requiring the na.rm argument ("remove NAs").

```
x < -c(1, 5, 7, 4, 2, 8, NA)
mean(x)
[1] NA
mean(x, na.rm = TRUE)
[1] 4.5
quantile(x)
Error in quantile.default(x): missing values and NaN's not allowed if 'na.rm' is FALSE
quantile(x, na.rm = TRUE)
 0% 25% 50%
               75% 100%
 1.0 2.5 4.5 6.5 8.0
```

We will talk more about data types later, but you can only do summarization on numeric or logical types. Not characters or factors.

```
x < -c(1, 5, 7, 4, 2, 8)
sum(x)
[1] 27
y <- c(TRUE, FALSE, FALSE, TRUE) # FALSE == 0 and TRUE == 1
sum(y)
[1] 2
z <- c("TRUE", "FALSE", "FALSE", "TRUE")
sum(z)
Error in sum(z): invalid 'type' (character) of argument
mean(z)
```

Warning in mean.default(z): argument is not numeric or logical: returning NA

Some examples

We can use the jhu_cars to explore different ways of summarizing data. The head command displays the first rows of an object:

```
library(jhur)
head(jhu_cars)
```

```
mpg cyl disp hp drat wt gsec vs am gear carb
1
        Mazda RX4 21.0
                       6 160 110 3.90 2.620 16.46 0 1
                                                             4
     Mazda RX4 Wag 21.0 6 160 110 3.90 2.875 17.02 0 1
2
        Datsun 710 22.8 4 108 93 3.85 2.320 18.61 1 1
3
                                                             1
    Hornet 4 Drive 21.4 6 258 110 3.08 3.215 19.44 1 0
                                                             1
4
5 Hornet Sportabout 18.7 8 360 175 3.15 3.440 17.02 0 0
6
          Valiant 18.1
                       6 225 105 2.76 3.460 20.22 1 0
                                                             1
```

Note - the \$ references/selects columns from a data.frame/tibble:

```
mean(jhu_cars$hp)

[1] 146.6875

quantile(jhu_cars$hp)

0% 25% 50% 75% 100%
52.0 96.5 123.0 180.0 335.0
```

```
The "tidy" way:

jhu_cars %>% pull(hp) %>% mean() # alt: pull(jhu_cars, hp) %>% mean()

[1] 146.6875

jhu_cars %>% pull(hp) %>% quantile()

0% 25% 50% 75% 100%
52.0 96.5 123.0 180.0 335.0
```

```
jhu_cars %>% pull(wt) %>% median()

[1] 3.325

jhu_cars %>% pull(wt) %>% quantile(probs = 0.6)

60%
3.44
```

Data Summarization on data frames

- Basic statistical summarization
 - rowMeans(x): takes the means of each row of x
 - colMeans(x): takes the means of each column of x
 - rowSums(x): takes the sum of each row of x
 - colSums(x): takes the sum of each column of x
 - summary(x): for data frames, displays the quantile information

TB Incidence

Let's read in a tibble of values from TB incidence.

If you have the jhur package installed successfully:

```
tb <- jhur::read_tb()</pre>
```

If not, download the xlsx file from this link and read it in using read_csv(): http://jhudatascience.org/intro_to_r/data/tb_incidence.xlsx

TB Incidence

Check out the data:

```
head(tb)
```

[2] "1990"

[3] "1991"

[4] "1992"

```
# A tibble: 6 \times 19

                                                        226
                                                              231
                                                                    236
# ... with 10 more variables: `1998` <dbl>, `1999` <dbl>, `2000` <dbl>,
   `2001` <dbl>, `2002` <dbl>, `2003` <dbl>, `2004` <dbl>, `2005` <dbl>,
   `2006` <dbl>, `2007` <dbl>
colnames(tb)
```

[1] "TB incidence, all forms (per 100 000 population per year)"

12/42

Indicator of TB

Before we go further, let's rename the first column to be the country measured using the rename function in dplyr.

In this case, we have to use the backticks (`) because there are spaces and funky characters in the name:

```
library(dplyr)
tb <- tb %>% rename(country = `TB incidence, all forms (per 100 000 population per year)`)
```

colnames will show us the column names and show that country is renamed:

```
colnames(tb)
```

```
"1993"
[1] "country" "1990"
                          "1991"
                                    "1992"
                                                          "1994"
                                                                    "1995"
[8] "1996"
               "1997"
                          "1998"
                                    "1999"
                                               "2000"
                                                          "2001"
                                                                    "2002"
                                    "2006"
                                               "2007"
[15] "2003"
               "2004"
                          "2005"
```

Summarize the data: dplyr summarize function

dplyr::summarize will allow you to summarize data. Format is new =
SUMMARY.

Summarize the data: dplyr summarize function

summarize can do multiple operations at once. Just separate by a comma.

Notice how when we forget to provide a new name, output is still provided, but the column name is messy.

Iterative summaries: dplyr summarize and across functions

Use the <u>across</u> function with <u>summarize</u> to summarize across multiple columns of your data.

```
tb %>%
          summarize(across( c(`1990`, `1991`, `1992`, `1993`), ~ sum(.x, na.rm = TRUE)))
# A tibble: 1 \times 4
            `1990` `1991` `1992` `1993`
               <dbl> <dbl> <dbl> <dbl>
1 21855 22288 22421 22836
tb %>%
          summarize(across( starts_with("2"), ~ range(.x, na.rm = TRUE)))
# A tibble: 2 × 8
            `2000` `2001` `2002` `2003` `2004` `2005` `2006` `2007`
               <dbl> <
                                               0 3 0 0
                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                0

                                                             916 994 1075
                                                                                                                                                                    1127
                                                                                                                                                                                                        1141
                                                                                                                                                                                                                                             1169
                                                                                                                                                                                                                                                                                  1198
```

Row means

colMeans and rowMeans require all numeric data.

Let's see what the mean is across each row (country):

```
tb_2 <- column_to_rownames(tb, "country") # opposite of rownames_to_column() !
head(tb_2, 2)</pre>
```

```
1990 1991 1992 1993 1994 1995 1996 1997 1998 1999 2000 2001 2002
Afghanistan
            168
                 168
                      168 168
                               168
                                     168
                                         168
                                              168
                                                                  168
                                                   168
                                                        168
                                                             168
                                                                       168

```

rowMeans(tb_2, na.rm = TRUE)

Albania	Afghanistan
24.000000	168.000000
American Samoa	Algeria
7.611111	46.388889
Angola	Andorra
243.888889	24.944444
Antigua and Barbuda	Anguilla

Row means

colMeans gives you very similar output to functions we've seen previously in this lecture (summarize and across).

```
colMeans(tb 2, na.rm = TRUE)
    1990
             1991
                      1992

summary Function

Using summary can give you rough snapshots of each column, but you would likely use mean, min, max, and quantile when necessary (and number of NAs):

1991

1992

summary(tb)

country

```

```

Length and unique

unique(x) will return the unique elements of x

```
locations <- yts %>% pull(LocationDesc)
unique(locations) %>% head()

[1] "Arizona" "Connecticut" "Georgia" "Hawaii" "Illinois"
[6] "Louisiana"
```

length will tell you the length of a vector. Combined with unique, tells you the number of unique elements:

```
length(unique(locations))
```

[1] 50

table and dplyr: count

table(x) will return a frequency table of unique elements of x

table(locations)

locations

Alabama	Arizona	Arkansas	
378	240	210	
California	Colorado	Connecticut	
96	48	384	
Delaware	District of Columbia	Florida	
312	48	96	
Georgia	Guam	Hawaii	
282	48	270	
Idaho	Illinois	Indiana	
48	282	264	
Iowa	Kansas	Kentucky	
276	186	255	
Louisiana	Maine	Maryland	
240	48	96	
Massachusetts	Michigan	Minnesota	
48	138	141	
Mississippi	Missouri	National (States and DC)	
567	294	26	

table and dplyr: count

Use count directly on a data.frame and column without needing to use pull.

yts %>% count(LocationDesc)

#	A tibble: 50 × 2	
	LocationDesc	n
	<chr></chr>	<int></int>
1	. Alabama	378
2	? Arizona	240
3	3 Arkansas	210
4	California	96
5	Colorado	48
6	Connecticut	384
7	Delaware	312
8	District of Columbia	48
S	Florida	96
10	Georgia	282
#	with 40 more rows	

table and dplyr: count

Multiple columns listed further subdivides the count.

yts %>% count(LocationDesc, TopicDesc)

```
# A tibble: 146 × 3
   LocationDesc TopicDesc
                                                  n
   <chr>
                <chr>
                                              <int>
 1 Alabama

#
```

Summarize the grouped data

It's grouped! Grouping doesn't change the data in any way, but how **functions operate on it**. Now we can summarize **Data_Value** (percent of respondents) by group:

Using the pipe to connect these

Pipe yts into group_by, then pipe that into summarize:

```
vts %>%
 group_by(Response) %>%
 summarize(avg_percent = mean(Data_Value, na.rm = TRUE),
          max_percent = max(Data_Value, na.rm = TRUE))
# A tibble: 4 \times 3
 Response avg_percent max_percent
 <chr>
         <dbl>
                        <dbl>
1 Current 9.68
                       40.6
      26.1 98
2 Ever
3 Frequent 3.48 23.9
4 <NA>
       53.5
                    81.9
```

Ungroup the data

The ungroup function will allow you to clear the groups from the data. You can also overwrite the first group_by with a new one.

```
yts = ungroup(yts)
yts
# A tibble: 9,794 × 31
    YEAR LocationAbbr LocationDesc TopicType
                                                   TopicDesc MeasureDesc DataSource
   <dbl> <chr>
                       <chr>
                                                   <chr>
                                     <chr>
                                                              <chr>
                                                                           <chr>
 1 2015 AZ

```

group_by with mutate - just add data

We can also use mutate to calculate the mean value for each year and add it as a column:

```
vts %>%
 group_by(YEAR) %>%
 mutate(year_avg = mean(Data_Value, na.rm = TRUE)) %>%
  select(LocationDesc, Data_Value, year_avg)
# A tibble: 9,794 × 4
# Groups: YEAR [17]
   YEAR LocationDesc Data_Value year_avg
  <dbl> <chr>
                          <dbl>
                                   <dbl>
 1 2015 Arizona
                           NA
                                    15.2
 2 2015 Arizona
                                    15.2
                           NA
 3 2015 Arizona
                                    15.2
                           NA
 4 2015 Arizona
                           NA
                                    15.2
 5 2015 Arizona
                                    15.2
                           NA
 6 2015 Arizona
                                    15.2
                           NA
 7 2015 Arizona
                          3.2
                                    15.2
 8 2015 Arizona
                           3.2
                                    15.2
   2015 Arizona
                           3.1
                                    15.2
10 2015 Arizona
                           12.5
                                    15.2
# ... with 9,784 more rows
```

Counting

There are other functions, such as n() count the number of observations.

```
yts %>%
 group_by(YEAR) %>%
  summarize(n = n(),
           mean = mean(Data_Value, na.rm = TRUE))
# A tibble: 17 × 3

Preview: plotting

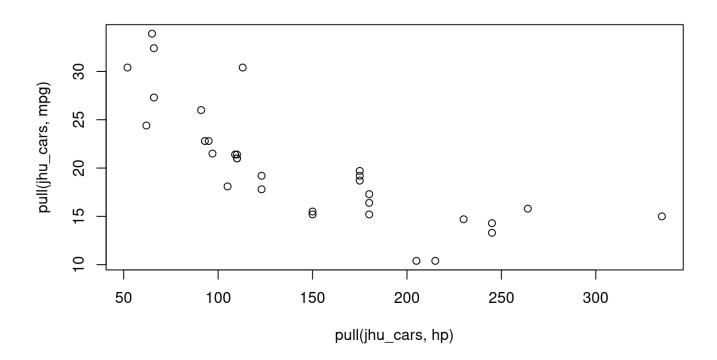

Basic Plots

Plotting is an important component of exploratory data analysis. These are some rough one-line plots that you can use in real time while exploring your data. We will go over formatting and making plots look nicer in additional lectures.

- Basic summarization plots:
 - plot(x,y): scatterplot of x and y
 - boxplot(y~x): boxplot of y against levels of x
 - hist(x): histogram of x
 - plot(density(x)): kernel density plot of x

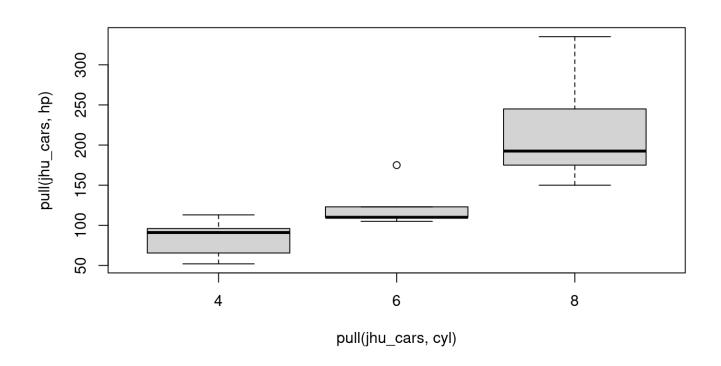

Scatterplot

plot(pull(jhu_cars,hp), pull(jhu_cars,mpg)) # alt: plot(jhu_cars\$hp, jhu_cars\$mpg)

Boxplot

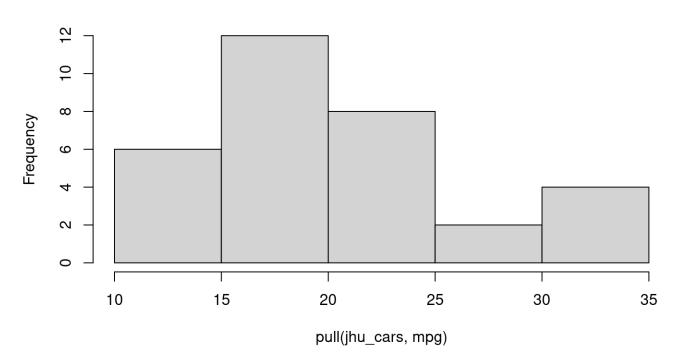

boxplot(pull(jhu_cars,hp) ~ pull(jhu_cars,cyl))

Histogram

hist(pull(jhu_cars,mpg))

Histogram of pull(jhu_cars, mpg)

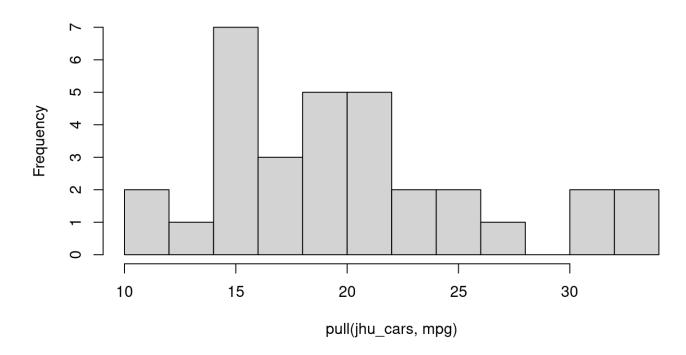

Histogram

Use the breaks = argument to tweak the resolution:

hist(pull(jhu_cars,mpg), breaks = 10)

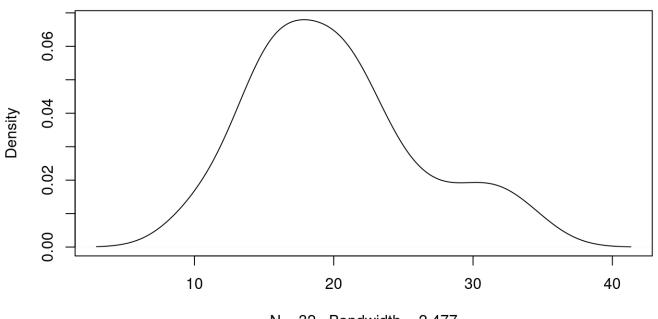

Histogram of pull(jhu_cars, mpg)

Density

plot(density(pull(jhu_cars,mpg)))

density.default(x = pull(jhu_cars, mpg))
