Functions

Writing your own functions

So far we've seen many functions, like c(), class(), filter(), dim() ...

Why create your own functions?

- Cut down on repetitive code (easier to fix things!)
- Organize code into manageable chunks
- Avoid running code unintentionally
- Use names that make sense to you

Writing your own functions

Here we will write a function that multiplies some number (x) by 2:

```
times_2 <- function(x) x * 2
```

When you run the line of code above, you make it ready to use (no output yet!). Let's test it!

```
times_2(x = 10)
[1] 20
```

Writing your own functions: { }

Adding the curly brackets - {} - allows you to use functions spanning multiple lines:

```
times_2 <- function(x) {
    x * 2
}
times_2(x = 10)
[1] 20</pre>
```

Writing your own functions: return

If we want something specific for the function's output, we use return():

```
times_2 <- function(x) {
  output <- x * 2
  return(output)
}
times_2(x = 10)
[1] 20</pre>
```

Writing your own functions

The general syntax for a function is:

```
functionName <- function(inputs) {
  <function body>
  return(value)
}
```

Writing your own functions: multiple inputs

Functions can take multiple inputs:

```
times_2_plus_y <- function(x, y) x * 2 + y times_2_plus_y(x = 10, y = 3)

[1] 23
```

Writing your own functions: defaults

Functions can have "default" arguments. This lets us use the function without using an argument later:

```
times_2_plus_y <- function(x = 10, y = 3) x * 2 + y times_2_plus_y()

[1] 23
```

Writing another simple function

Let's write a function, sqdif, that:

- 1. takes two numbers x and y with default values of 2 and 3.
- 2. takes the difference
- 3. squares this difference
- 4. then returns the final value

Writing another simple function

```
sqdif <- function(x = 2, y = 3) (x - y)^2
sqdif()
[1] 1
sqdif(x = 10, y = 5)
[1] 25
sqdif(10, 5)
[1] 25</pre>
```

Writing your own functions: characters

Functions can have any kind of input. Here is a function with characters:

```
loud <- function(word) {
  output <- rep(toupper(word), 5)
  return(output)
}
loud(word = "hooray!")

[1] "HOORAY!" "HOORAY!" "HOORAY!" "HOORAY!"</pre>
```

Functions for tibbles

We can use filter(row_number()==n) to extract a row of a tibble: cars <- read_kaggle()</pre> get_row <- function(dat, row) dat %>% filter(row_number() == row) $get_row(dat = cars, row = 10)$ # A tibble: 1 × 10 RefId IsBadBuy PurchDate Auction VehYear VehicleAge Make Model Trim SubModel <dbl> <chr> <dbl> <dbl> <chr> <chr< <chr> <chr> <chr< <chr< <chr> <chr< <chr< <chr> <chr< <chr> <chr< <chr> <chr< <chr> <chr< <chr> <chr< <chr< <chr> <chr< <chr> <chr< <chr> <chr< <chr> <chr< <chr> <chr< < <dbl> <chr> 0 12/7/2009 ADESA 2007 2 FORD FIVE... SEL 1 10 4D SEDA...

Functions for tibbles

```
select(n) will choose column n:

get_index <- function(dat, row, col) {
    dat %>%
        filter(row_number() == row) %>%
        select(col)
}

get_index(dat = cars, row = 10, col = 8)

# A tibble: 1 × 1
    Model
    <chr>
1 FIVE HUNDRED
```

Functions for tibbles

Including default values for arguments:

```
get_top <- function(dat, row = 1, col = 1) {
    dat %>%
        filter(row_number() == row) %>%
        select(col)
}

get_top(dat = cars)

# A tibble: 1 × 1
    RefId
    <dbl>
1     1
```

Using your custom functions: sapply()

Now that you've made a function... You can "apply" functions easily with sapply()!

These functions take the form:

sapply(<a vector or list>, some_function)

Using your custom functions: sapply()

 ${ t I}$ There are no parentheses on the functions! ${ t I}$

sapply(cars, class)

RefTd **IsBadBuy** "numeric" "numeric" PurchDate Auction "character" "character" VehicleAge VehYear "numeric" "numeric" Make Model 1 "character" "character" SubModel 1 Trim "character" "character" Color Transmission "character" "character" WheelTypeID WheelType "character" "character" Veh0do Nationality "numeric" "character" Size **TopThreeAmericanName** "character" "character" MMRAcquisitionAuctionAveragePrice MMRAcquisitionAuctionCleanPrice "character" "character" MMRAcquisitonRetailCleanPrice MMRAcquisitionRetailAveragePrice "character" "character" MMRCurrentAuctionCleanPrice MMRCurrentAuctionAveragePrice "character" "character" MMRCurrentRetailCleanPrice MMRCurrentRetailAveragePrice

Using your custom functions: sapply()

sapply(pull(cars, VehOdo), times_2_plus_y)

                                                                      93.395
                                                                               53.463
```

across() makes it easy to apply the same transformation to multiple columns. Usually used with summarize().

```
across( .cols = <columns>, .fns = function, ... )
```

- List columns first:.cols =
- List function next: .fns =
- Then list any arguments for the function

Combining with summarize():

```
cars dbl <- cars %>% select(Make, Model, where(is.double))
cars dbl %>%
  group_by(Make) %>%
  summarize(across(.cols = everything(), .fns = mean))
# A tibble: 33 × 12

Summary

- · Simple functions take the form:
 - NEW_FUNCTION <- function(x, y) x + y ..
 - Can specify defaults like function(x = 1, y = 2)
- Apply your functions with sapply(<a vector or list>, some_function)
- · Use across() to apply functions across multiple columns of data
