Subsetting Data in R

Overview

In this module, we will show you how to:

- 1. Look at your data in different ways
- 2. Create a data frame and a tibble
- 3. Create new variables/make rownames a column
- 4. Rename columns of a data frame
- 5. Subset rows of a data frame
- 6. Subset columns of a data frame
- 7. Add/remove new columns to a data frame
- 8. Order the columns of a data frame
- 9. Order the rows of a data frame

Setup

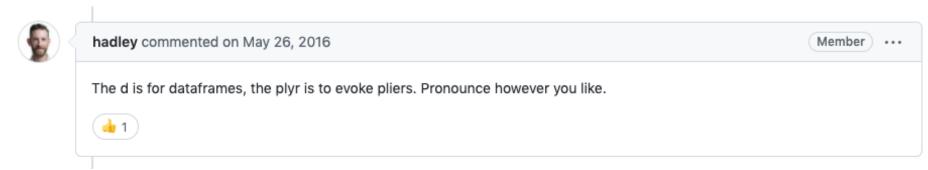

We will largely focus on the dplyr package which is part of the tidyverse.

Some resources on how to use dplyr:

- https://dplyr.tidyverse.org/
- https://cran.r-project.org/web/packages/dplyr/vignettes/dplyr.html
- https://www.opencasestudies.org/

Why dplyr?

The dplyr package is one of the most helpful packages for altering your data to get it into a form that is useful for creating visualizations, summarizing, or more deeply analyzing.

So you can imagine using pliers on your data.

Loading in dplyr and tidyverse

See this website for a list of the packages included in the tidyverse: https://www.tidyverse.org/packages/

library(tidyverse) # loads dplyr and other packages!

Getting data to work with

Here we use one of the datasets that comes with base R called mtcars. We will now create a toy data frame named df using this data. This way we can alter df without worrying about changing mtcars.

df <- mtcars # df is a copy of mtcars
head(df) # changing df does **not** change mtcars!</pre>

	mpg	cyl	disp	hp	drat	wt	qsec	VS	am	gear	carb
Mazda RX4	21.0					2.620					4
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875	17.02	0	1	4	4
Datsun 710	22.8	4	108	93	3.85	2.320	18.61	1	1	4	1
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3	1
Hornet Sportabout	18.7	8	360	175	3.15	3.440	17.02	0	0	3	2
Valiant	18.1	6	225	105	2.76	3.460	20.22	1	0	3	1

Checking the data dim()

The dim(), nrow(), and ncol() functions are good options to check the dimensions of your data before moving forward.

```
dim(df) # rows, columns
[1] 32 11
nrow(df) # number of rows
[1] 32
ncol(df) # number of columns
[1] 11
```

Checking the data: glimpse()

In addition to head() and tail(), the glimpse() function of the dplyr package is another great function to look at your data.

```
Rows: 32
Columns: 11
$ mpg <dbl> 21.0, 21.0, 22.8, 21.4, 18.7, 18.1, 14.3, 24.4, 22.8, 19.2, 17.8,...
$ cyl <dbl> 6, 6, 4, 6, 8, 6, 8, 4, 4, 6, 6, 8, 8, 8, 8, 8, 8, 4, 4, 4, 4, 8,...
$ disp <dbl> 160.0, 160.0, 108.0, 258.0, 360.0, 225.0, 360.0, 146.7, 140.8, 16...
$ hp <dbl> 110, 110, 93, 110, 175, 105, 245, 62, 95, 123, 123, 180, 180, 180...
$ drat <dbl> 3.90, 3.90, 3.85, 3.08, 3.15, 2.76, 3.21, 3.69, 3.92, 3.92, 3.92,...
$ wt <dbl> 2.620, 2.875, 2.320, 3.215, 3.440, 3.460, 3.570, 3.190, 3.150, 3....
$ qsec <dbl> 16.46, 17.02, 18.61, 19.44, 17.02, 20.22, 15.84, 20.00, 22.90, 18...
$ vs <dbl> 0, 0, 1, 1, 0, 1, 0, 1, 1, 1, 1, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1, 0, ...
$ gear <dbl> 4, 4, 4, 3, 3, 3, 3, 4, 4, 4, 4, 3, 3, 3, 3, 3, 4, 4, 4, 4, 3, 3, ...
$ carb <dbl> 4, 4, 1, 1, 2, 1, 4, 2, 2, 4, 4, 3, 3, 3, 3, 4, 4, 4, 4, 1, 2, 1, 1, 2, ...
```

Checking your data: slice_sample()

What if you want to see the middle of your data? You can use the slice_sample() function of the dplyr package to see a random set of rows. You can specify the number of rows with the n argument or use a proportion with the prop argument.

```
slice_sample(df, n = 3)
                mpg cyl disp hp drat wt gsec vs am gear carb
Hornet 4 Drive
              21.4 6 258.0 110 3.08 3.215 19.44 1 0
Honda Civic 30.4 4 75.7 52 4.93 1.615 18.52
Pontiac Firebird 19.2 8 400.0 175 3.08 3.845 17.05 0 0
slice_sample(df, prop = .2)
                  mpg cyl disp hp drat wt qsec vs am gear carb
                 22.8 4 108.0 93 3.85 2.320 18.61 1
Datsun 710
Porsche 914-2
                 26.0 4 120.3 91 4.43 2.140 16.70
                                                               4
Chrysler Imperial 14.7 8 440.0 230 3.23 5.345 17.42
Cadillac Fleetwood 10.4 8 472.0 205 2.93 5.250 17.98
Merc 450SLC
             15.2 8 275.8 180 3.07 3.780 18.00
Dodge Challenger 15.5 8 318.0 150 2.76 3.520 16.87
```

skimr package

library(skimr)
skim(df)

```
> skim(df)

Porsche 914-2	26.0	4	120.3			2.140		0	1	5	2

Keep in mind...

Need to assign the output of the function to keep the result!

```
df_updated <- data.frame(df)
# this would overwrite the existing df object
df<-data.frame(df)</pre>
```

Or create a data frame when reading in the file

Or directly when reading in a csv with the read.csv() function (also base R)

```
# function comes from base R - no package loading required
df_example_readr <- read.csv(file = "documents/data_analysis/data_file.csv")</pre>
```

tibble

We can create a **fancier** version of the previous data frame which can be really helpful.

Creating a tibble

If we would like to create a tibble ("fancy" data frame), we can using the tibble() function.

```
tbl <- dplyr::tibble(df)
tbl
# A tibble: 32 × 11
                                                          cyl disp
                                                                                                                                hp
                                                                                                                                                     drat
                                                                                                                                                                                                wt
                                                                                                                                                                                                                     gsec
                                                                                                                                                                                                                                                                VS
                                                                                                                                                                                                                                                                                                                                                      carb
                           mpg
                                                                                                                                                                                                                                                                                                 am
                                                                                                                                                                                                                                                                                                                      gear
                <dbl> <
                     21
                                                                                      160
                                                                                                                           110
                                                                                                                                                    3.9
                                                                                                                                                                                      2.62
                                                                                                                                                                                                                      16.5
                                                                     6
                                                                                                                                                                                                                                                                                                                                       4
                                                                                                                                                                                                                                                                                                                                                                       4
                     21
                                                                                     160
                                                                                                                           110
                                                                                                                                                 3.9

                                                                                                                                                                                                                      18.3
                                                                                                                                                                                                                                                                      1
                                                                                                                                                                                                                                                                                                                                       4
                                                                                                                                                                                                                                                                                                                                                                       4
# ... with 22 more rows
```

Note don't necessarily need to use head()- tibbles conveniently print a portion of the data.

tibbles form read_csv()

Alternatively we can read data files using the tidyverse with the read_csv() function of the readr package from the tidyverse to make a tibble.

```
df_example_readr <- read_csv(file = "documents/data_analysis/data_file.csv")</pre>
```

You may start to notice how the tidyverse package work well together!

Summary of tibbles and data frames

Base R:

Using read.csv() and data.frame() you can make data frames

Tidyverse (fancier version):

Using read_csv() and tibble() you can make tibbles

We generally recommend using tibbles, but you can do a lot with data frames too.

Data frames vs tibbles

In the "tidy" data format, rownames are removed. For example, df has each car name as a row name. Here we use the head() function to see the first 2 rows of each using the n argument. In this case we would want to make the rownames a new column first before making into a tibble.

```
head(df, n = 2)
                                                                                      mpg cyl disp hp drat wt gsec vs am gear carb
                                                                                                                           6 160 110 3.9 2.620 16.46 0 1

                                                                                                   160
                                                                                                                                        110 3.9
                                                                                                                                                                                                           2.88 17.0
```

rownames_to_column function

If you run into losing a variable contained in your row names, you can also use rownames_to_column to add it before turning it into a tibble to keep them:

```
head(rownames_to_column(df, "car"), n = 2)
        car mpg cyl disp hp drat wt qsec vs am gear carb
    Mazda RX4 21 6 160 110 3.9 2.620 16.46 0 1
2 Mazda RX4 Wag 21 6 160 110 3.9 2.875 17.02 0 1
head(tibble(rownames_to_column(df, "car")), n = 2)
# A tibble: 2 \times 12
                cyl disp hp drat wt gsec
                                                am gear carb
 car
            mpg
                                          VS
 1 Mazda RX4
                         110 3.9 2.62 16.5
             21
                  6
                     160
                                                 1
                                                     4
                         110 3.9 2.88 17.0 0
2 Mazda RX4 W... 21 6
                     160
```

Renaming Columns

Renaming Columns of a data frame or tibble

To rename columns in dplyr, you can use the rename function.

For example, let's rename mpg to MPG. Notice the new name is listed **first**!

```
# general format! not code!
{data you are creating or changing} <- rename( {data you are using},
                                          \{New Name\} = \{Old name\}\}
df <- dplyr::rename(df, MPG = mpg)</pre>
head(df)
                    MPG cyl disp hp drat wt gsec vs am gear carb
Mazda RX4
                   21.0

Renaming All Columns of a data frame: dplyr

To rename all columns you use the rename_with(). In this case we will use toupper() to make all letters upper case. Could also use tolower() function.

```
df_upper <- dplyr::rename_with(df, toupper)</pre>
head(df_upper, 3)
             MPG CYL DISP HP DRAT WT QSEC VS AM GEAR CARB
Mazda RX4
            21.0 6 160 110 3.90 2.620 16.46 0 1
Mazda RX4 Wag 21.0 6 160 110 3.90 2.875 17.02 0 1 4
Datsun 710 22.8 4 108 93 3.85 2.320 18.61 1 1 4
df <- dplyr::rename_with(df, tolower)</pre>
head(df, 3)
             mpg cyl disp hp drat wt gsec vs am gear carb
            21.0 6 160 110 3.90 2.620 16.46 0 1
Mazda RX4
Mazda RX4 Wag 21.0 6 160 110 3.90 2.875 17.02 0 1 4
            22.8 4 108 93 3.85 2.320 18.61 1 1
                                                         1
Datsun 710
```

Summary

- · data frames are simpler version of a data table
- tibbles are fancier `tidyverse version
- data frames are made with data.frames() and read.csv()
- tibbles are made with tibble() and read_csv() from readr
- the rename() function of dplyr can help you rename columns

Lab Part 1

Lab

Subsetting Columns

Subset columns of a data frame:

We can grab the carb column using the \$ operator. This is the base R way to do this:

df\$carb

[1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2

Subset columns of a data frame - tidyverse way:

To grab the carb column the tidyverse way we can use the pull function:

```
pull(df, carb)
```

[1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2

Subset columns of a data frame: dplyr

The select command from dplyr allows you to subset (gives a tibble!)

select(df, mpg)

09.0.8.4.7.1.3.4.8.2.8.4.3.2.4.4.7.4.4.9.5.5

Subset columns of a data frame: dplyr

Note that if you want the values (not a tibble), use pull (or \$ if you were using base R):

```
pull(df, mpg)

[1] 21.0 21.0 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 17.8 16.4 17.3 15.2 10.4 [16] 10.4 14.7 32.4 30.4 33.9 21.5 15.5 15.2 13.3 19.2 27.3 26.0 30.4 15.8 19.7 [31] 15.0 21.4

# pull with select works too!

pull(select(df, mpg))

[1] 21.0 21.0 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 17.8 16.4 17.3 15.2 10.4 [16] 10.4 14.7 32.4 30.4 33.9 21.5 15.5 15.2 13.3 19.2 27.3 26.0 30.4 15.8 19.7 [31] 15.0 21.4
```

Select columns of a data frame: dplyr

The select command from dplyr allows you to subset columns matching strings:

select(df, mpg, cyl)

Merc 230 22.8 4 Merc 280 19.2	1 6 6 4 6 8 6 8 4 4 6 6
Merc 450SE 16.4 8 Merc 450SL 17.3	3
Cadillac Fleetwood 10.4	3
Chrysler Imperial 14.7 8	3 3 4
Honda Civic 30.4	4 4
Toyota Corona 21.5 2 Dodge Challenger 15.5	4 8 8

See the Select "helpers"

Here are a few:

```
one_of() # if they exist
last_col()
ends_with()
contains() # like searching
```

Type tidyselect:: in the console and see what RStudio suggests:

tidyslect::

Summary

- the \$ is used base R to get the values of a column from a data frame or tibble
- pull() is the tidyverse way
- select() is the tidyverse way to get a tibble with only certain columns
- you can select() based on patterns in the column names

                                                          5
Porsche 914-2
             26.0 4 120.3
                                                     1
                              91 4.43 2.140 16.70
                                                          5
              30.4 4 95.1 113 3.77 1.513 16.90
                                                     1
Lotus Europa
                     4 121.0 109 4.11 2.780 18.60
Volvo 142E
              21.4
```

Note, no subsetting is necessary. R "knows" mpg refers to a column of df.

You can have multiple logical conditions using the following:

- · ==: equals to
- !=: not equal to (!: not/negation)
- · > / <: greater than / less than
- >= or <=: greater than or equal to / less than or equal to
- · &: AND
- · |: OR

The %in% operator can be used find values from a pre-made list (using c()):

```
filter(df, mpg %in% c(20,21,22))
```

```
mpg cyl disp hp drat wt qsec vs am gear carb
Mazda RX4 21 6 160 110 3.9 2.620 16.46 0 1 4 4
Mazda RX4 Wag 21 6 160 110 3.9 2.875 17.02 0 1 4 4
```

You can filter by two conditions using & or commas:

```
filter(df, mpg > 20 & cyl == 4)
```

```
mpg cyl
                       disp
                             hp drat wt gsec vs am gear carb
Datsun 710
              22.8

```

which() function

Instead of removing rows like filter, which() simply shows where the values occur if they pass a specific condition. We will see that this can be helpful later when we want to select and filter in more complicated ways.

```
which(select(df,carb) == 4)
 [1] 1 2 7 10 11 15 16 17 24 29
select(df, carb) == 4
                     carb
Mazda RX4
                     TRUE
Mazda RX4 Waq
                     TRUE
Datsun 710
                    FALSE
Hornet 4 Drive
                    FALSE

                    TRUE
Chrysler Imperial
                     TRUE
```

Summary

- filter() can be used to filter out rows based on logical conditions
- == is the same as equivalent to
- & means both conditions must be met to remain after filter()
- I means either conditions needs to be met to remain after filter()
- which() shows you where values meet a condition

Lab Part 3

Class Website
Lab

Combining filter and select

You can combine filter and select to subset the rows and columns, respectively, of a data frame:

```
select(filter(df, mpg > 20 \& cyl == 4), cyl, hp)
```

	cyl	hp
Datsun 710	4	93
Merc 240D	4	62
Merc 230	4	95
Fiat 128	4	66
Honda Civic	4	52
Toyota Corolla	4	65
Toyota Corona	4	97
Fiat X1-9	4	66
Porsche 914-2	4	91
Lotus Europa	4	113
Volvo 142E	4	109

In R, the common way to perform multiple operations is to wrap functions around each other in a nested way such as above.

Assigning Temporary Objects

One can also create temporary objects and reassign them:

Using the pipe (comes with dplyr):

Recently, the pipe %>% makes things such as this much more readable. It reads left side "pipes" into right side. RStudio CMD/Ctrl + Shift + M shortcut. Pipe df into filter, then pipe that into select:

```
df %>% filter(mpg > 20 & cyl == 4) %>% select(cyl, hp)
```

	cyl	hp
Datsun 710	4	93
Merc 240D	4	62
Merc 230	4	95
Fiat 128	4	66
Honda Civic	4	52
Toyota Corolla	4	65
Toyota Corona	4	97
Fiat X1-9	4	66
Porsche 914-2	4	91
Lotus Europa	4	113
Volvo 142E	4	109

Adding/Removing Columns

Adding new columns to a data frame: base R

You can add a new column, called **newcol** to **df**, using the \$ operator:

```
df$newcol <- df$wt/2.2
head(df,3)</pre>
```

```
mpg cyl disp hp drat wt qsec vs am gear carb newcol Mazda RX4 21.0 6 160 110 3.90 2.620 16.46 0 1 4 4 1.190909 Mazda RX4 Wag 21.0 6 160 110 3.90 2.875 17.02 0 1 4 4 1.306818 Datsun 710 22.8 4 108 93 3.85 2.320 18.61 1 1 4 1 1.054545
```

Adding columns to a data frame: dplyr (tidyverse way)

The \$ method is very common.

The mutate function in dplyr allows you to add or modify columns of a data frame.

Removing columns of a data frame: base R

You can remove a column by assigning to **NULL**:

df\$newcol <- NULL

Removing columns of a data frame: dplyr

The **NULL** method is still very common.

The select function can remove a column with minus (-):

```
select(df, - newcol)
```

```
        Mazda RX4
        21.0
        6
        160
        110

        20.22
        1
        0
        3
        1
```

Or, you can simply select the columns you want to keep, ignoring the ones you want to remove.

Removing columns to a data frame: dplyr

You can use c() to list the columns to remove.

Remove newcol and drat:

```
select(df, -c("newcol", "drat"))
```

	mpg	cyl	disp	hp	wt	qsec	VS	am	gear	carb

Ordering columns

Ordering the columns of a data frame: dplyr

The select function can reorder columns.

```
head(df)
select(df, cyl, mpg, wt, car) %>%
head()
```

Ordering the columns of a data frame: dplyr

We can also use the relocate() function of dplyr to rearrange the columns.

For example, let say we just wanted wt to be first.

head(df)

```
mpg cyl disp
                                 hp drat
                                               gsec vs am gear carb
                                                                       newcol
                                            wt

```

Summary

- select() and filter() can be combined together
- you can do sequential steps in a few ways:
 - 1. nesting them inside one another using parentheses ()
 - 2. creating intermediate data objects in between
 - 3. using pipes %>%
- arrange() can be used to reorder rows
- select() and relocate() can be used to reorder columns
- · can remove a column by:
 - 1. assigning a column to NULL
 - 2. using select() with negative sign in front of column name(s)
 - 3. not selecting it (without negative sign)
- recall that filter() is how you remove rows
- mutate() can be used to create new variables or modify them

Summary cont...

mutate() can be used to create new variables or modify them

Creating conditional variables

One frequently-used tool is creating variables with conditions.

A general function for creating new variables based on existing variables is the ifelse() function, which "returns a value depending on whether the element of test is TRUE or FALSE."

```
ifelse(test, yes, no)

# test: an object which can be coerced
    to logical mode.
# yes: return values for true elements of test.
# no: return values for false elements of test.
```

ifelse example

```
[1] 160.0 160.0 108.0 258.0 360.0 225.0 360.0 146.7 140.8 167.6 167.6 275.8
[13] 275.8 275.8 472.0 460.0 440.0 78.7 75.7 71.1 120.1 318.0 304.0 350.0
[25] 400.0 79.0 120.3 95.1 351.0 145.0 301.0 121.0

Now with ifelse()

#ifelse(test, yes, no)
ifelse(df$disp <= 200, "low", "high")

[1] "low" "low" "low" "high" "high" "high" "high" "low" "low" "low"
[11] "low" "high" "high" "high" "high" "low" "low" "low"
[21] "low" "high" "high" "high" "low" "low" "low"
[31] "high" "low"</pre>
```

Adding columns to a data frame: dplyr

Combined with ifelse(condition, TRUE, FALSE), it can give you:

Adding columns to a data frame: dplyr

Alternatively, case_when provides a clean syntax as well:

Renaming Columns of a data frame: base R

We can use the **colnames** function to extract and/or directly reassign column names of **df**:

```
colnames(df) # just prints
               "cyl"
                             "disp"
                                        "hp"
                                                    "drat"
                                                                "wt"
     "mpg"
    "gsec" "vs"
                                        "gear"
                             "am"
                                                    "carb"
                                                                "newcol"
[13] "disp_cat" "disp_cat2"
colnames(df)[1:3] <- c("MPG", "CYL", "DISP") # reassigns</pre>

colnames(df)[ colnames(df) == "DRAT"] <- "drat" #reset
```

Subset rows of a data frame with indices:

Let's select **rows** 1 and 3 from **df** using brackets:

```
df[ c(1, 3), ]

mpg cyl disp hp drat wt qsec vs am gear carb newcol disp_cat
Mazda RX4 21.0 6 160 110 3.90 2.62 16.46 0 1 4 4 1.190909 Low
Datsun 710 22.8 4 108 93 3.85 2.32 18.61 1 1 4 1 1.054545 Low
disp_cat2
Mazda RX4 Low
Datsun 710 Low
```

Subset columns of a data frame:

We can also subset a data frame using the bracket [,] subsetting.

For data frames and matrices (2-dimensional objects), the brackets are [rows, columns] subsetting. We can grab the x column using the index of the column or the column name ("carb")

```
df[, 11]
[1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2
df[, "carb"]
[1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2
```

Biggest difference between tbl and data frame:

... with 22 more rows

tbl[, "mpg"]

Mostly, tbl (tibbles) are the same as data frames, except they don't print all lines. When subsetting only one column using brackets, a data frame will return the values, but a tbl will return a tbl

```
df[, 1]
 [1] 21.0 21.0 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 17.8 16.4 17.3 15.2 10.4
\begin{bmatrix} \bar{1}6 \end{bmatrix} 10.4 14.7 32.4 30.4 33.9 21.5 15.5 15.2 13.3 19.2 27.3 26.0 30.4 15.8 19.7
[31] 15.0 21.4
tbl[, 1]
# A tibble: 32 × 1
     mpg
   <dbl>
   21
   21
 3 22.8
 4 21.4
 5 18.7
6 18.1
   14.3
 8 24.4
 9 22.8
10
    19.2
```

Subset columns of a data frame:

We can select multiple columns using multiple column names:

```
df[, c("mpg", "cyl")]
```
